Installing APIs

With Cocoapods!

Cocoapods

- Easiest way to integrate third party libraries

- Anything you find on Github usually has a Cocoapod

- Auto update and maintain

- Workspaces rather than a project file

Who is afraid of the terminal?

Do you have Ruby?

```
ruby -v
```

```
sudo gem install cocoapods
```

Installs to system ruby

We need to make a podfile

- Says which libraries are included

- Easy update

- Others know what libraries you're using

go.osu.edu/macpod

```
cd path/to/project
```

```
touch Podfile
```

```
pod install
```

AFNetworking & ObjectiveSugar were installed!
